## WHIPSAW INC.

### Optovue Retina Scanner

RT Vue is an imaging device used by doctors to examine the retina. It is used to diagnose retina conditions and diseases such as glaucoma, macular hole degeneration, and diabetic retinopathy. It uses OCT technology (interferometric infra- red light) to create microscopic hi-resolution cross sections of the retina, down to 5 micrometers resolution. It scans safely, instantly, and painlessly, so the patient's experience is pleasant. The top adjusts left/right, in/out and up/down to fit every patient. One joystick simultaneously controls all of these motions, which is intuitive and convenient for the doctor.

Awards: Medical Design Excellence Award Gold 2007; Red Dot 2006, G-Mark 2006; Business 2.0 Bottom Line Award 2007.
